Component Connection Map

Why We Build It This Way

Understanding the interlocking architecture of your
business operating system

MARSHALL WILKINSON | ALP

The ALP/EOS Component Connection Map

Why We Build It This Way

The ALP/EOS system is not a menu of options where you pick and choose what you like. It is an **interlocking architecture**. Every component relies on the one before it. If you skip a step, the system breaks. This map explains why we sequence the build the way we do, and how each piece connects to solve the specific problems in your contracting business.

The Core Architecture: The Parent/Child Framework

Think of your business operating system like a building's structure. You cannot pour the second-floor slab before the foundation is cured. In ALP/EOS, the **Vision/Traction Organizer (V/TO)** is the foundation. It is the "Parent" document. Everything else in the system is a "Child" that inherits its direction from the V/TO.

If you try to hold people accountable without a Vision, you are just micromanaging. If you try to track data without an Accountability Chart, you have numbers with no owners.

Each component depends on the one before it. Skip a step and the system breaks.

How the Six Components Lock Together

1 VISION — The Anchor

THE TOOL

Vision/Traction Organizer (V/TO)

WHY IT COMES FIRST

Before you can decide who should do what, you must define where the company is going and what kind of work you do. If your V/TO says you only do \$2M+ commercial site work, that immediately dictates the kind of estimators and project managers you need.

THE CONNECTION

The V/TO dictates the structure of the Accountability Chart.

2 PEOPLE — The Structure

THE TOOL

Accountability Chart

WHY IT COMES SECOND

Once you know where you are going, you must define the functions required to get there. You cannot assign goals or metrics to a group. You can only assign them to a specific seat with a single owner.

THE CONNECTION

The Accountability Chart creates the "seats" that will own the numbers on the Scorecard and the priorities in the Rocks.

3 DATA — The Pulse

THE TOOL

Weekly Scorecard

WHY IT COMES THIRD

You now have a Vision and seats with owners. But how do you know if those people are actually moving the company toward the Vision? The Scorecard tracks 5 to 15 leading indicators — bids submitted, safety incidents, AR over 30 days.

THE CONNECTION

Every number on the Scorecard must be owned by exactly one person on the Accountability Chart. When a number drops below its goal, it automatically becomes an Issue.

4 ISSUES — The Filter

THE TOOL

Issues List & IDS (Identify, Discuss, Solve)

WHY IT COMES FOURTH

When Scorecard numbers are off track, you have an Issue. Most contractors complain about issues or put band-aids on them. IDS forces you to identify the root cause and solve it permanently.

THE CONNECTION

Issues are solved during the weekly L10 Meeting.

5 PROCESS — The Standard

THE TOOL

Core Process Documentation

WHY IT COMES FIFTH

When you solve an Issue permanently, the solution usually requires changing how you do things. That new way becomes your documented Core Process. This is how you stop relying on the heroics of your best people and start relying on a system.

THE CONNECTION

Documented processes ensure the people in the Accountability Chart can hit the numbers on their Scorecard consistently.

6 TRACTION — The Engine

THE TOOL

Rocks (90-Day Priorities) & The L10 Meeting

WHY IT COMES LAST

Traction is the execution engine. Rocks are the 3 to 7 most important things the company must achieve in the next 90 days. The L10 Meeting is the weekly rhythm where you review the Scorecard, check on Rocks, and solve Issues.

THE CONNECTION

Traction is what makes the Vision a reality. Without Traction, Vision is just a hallucination.

What Happens When You Skip a Step

The consequences of skipping a component are not theoretical. These are the exact problems we see in contracting businesses every day. Each one traces directly back to a missing piece of the operating system.

Skip Vision: Your team works hard but rows in different directions. You take on bad jobs because you have no Core Focus. Every decision routes through the owner because nobody else knows the direction.

Skip People (Accountability Chart): Everyone does a little bit of everything. When a project goes bad, everyone points fingers because nobody was solely accountable. You cannot fire or coach someone when their responsibilities were never defined.

Skip Data (Scorecard): You manage by gut feel and the balance in the checking account. You only find out a job lost money after it is finished. Problems are invisible until they become emergencies.

Skip Issues (IDS): You discuss the same problems every week for years but never actually solve them. Band-aids accumulate. Your best people burn out because they are constantly firefighting the same fires.

Skip Process: Your best superintendent runs a tight ship, but when he is on vacation, the wheels come off. Knowledge lives in people's heads, not in documented systems. You cannot scale what you cannot replicate.

Skip Traction (L10 & Rocks): The whirlwind of daily construction chaos consumes 100% of your time. You never work on the business, only in it. Quarterly goals are set and forgotten by week three.

The Bottom Line: We build the V/TO first. We build the Accountability Chart second. We do not move to the next step until the foundation is solid.
